

1. Write program demonstrates how to use regular expressions in Python to match and search for patterns in text.

```
|
Js
▶ import re

text = "My email is test123@gmail.com and phone is 9876543210"

# Match email
email_pattern = r'\b[\w.-]+@[ \w.-]+\.\w+\b'
emails = re.findall(email_pattern, text)

# Match phone number (10 digits)
phone_pattern = r'\b\d{10}\b'
phones = re.findall(phone_pattern, text)

print("Emails found:", emails)
print("Phone numbers found:", phones)

... Emails found: ['test123@gmail.com']
Phone numbers found: ['9876543210']
```
